BPUT 2026 PPT PITCH DECK SCRIPT:

Slide 1:

Good Morning everyone,

We are team "StackPhantom" and today we are here to give the solution for the "BPUT Hackathon 2026" for problem the problem statement number 8 "Develop of an online portal for BRSR reporting of corporate ESG reports"

Now let's start with a question : "If a company has hundreds of projects generating ESG data everyday, is having the data enough?"

Not really.

The real challenge is knowing whether that data is correct, whether it has supporting evidence, who submitted it, who approved it, how it became a group level number, and finally where that number is appears in the BRSR report.

That is the problem and we are going to solve it through "Proofly"

Slide 2:

Let me start with a simple example.

Say a project site records the following in one reporting period: **1,20,000 kWh of electricity, 15,000 litres of diesel, 8 lakh litres of water, 120 tonnes of waste**, plus employee and safety information.

Nothing unusual there. Any project would generate numbers like these.

So the problem isn't that the data doesn't exist.

The problem is what happens to it after it's created.

Today, the electricity data might be in one file, the diesel invoice somewhere else, water in another record, and employee data in an HR system.

So when the Group ESG team needs one reliable number, they're not just reading a report. They're stitching together pieces from all over the place.

And that's where things start going wrong.

Slide 3:

Now take that one project and multiply it across the organization.

Data comes in through Excel files, ERP systems, PDFs, invoices, meter readings, HR systems, emails, project records. The Group ESG team ends up collecting from a lot of different channels.

For example, someone sends electricity data in an Excel sheet, the invoice comes separately, and the approval happens over email.

Now imagine repeating that across around **250 projects**.

At that point, data entry isn't really the difficulty. The difficulty is answering questions like:

Which number is the right one? What's the unit? Where's the supporting evidence? Who submitted it? Who approved it?

That's the gap we wanted to close.

Slide 4:

Why the current process fails and where it is gets serious, so let me use one example:

Suppose a project reported **50,000 kWh** last year, and this year it suddenly shows **1,20,000 kWh**.

Is that wrong?

Not necessarily. The project might have grown. Operations might have increased. There could be a perfectly good reason.

But if nobody asks the question, the system just carries the number forward.

Then there's the issue of units. One person enters **1,20,000 kWh**, another works in **120 MWh**. It's the same quantity, but if nothing is standardized, consolidating by hand becomes risky.

Then evidence. A number may be sitting there, but whoever reviews it often has to dig through emails and folders to find the invoice or meter record behind it.

And after all that, someone still has to consolidate everything and write the report.

So it isn't one big failure. It's a chain of small problems, and together they can affect how reliable the final BRSR number is.

Slide 5:

Now let's talk about scale.

MEIL isn't one project with one reporting team. There's a hierarchy: **Group, Subsidiaries, Business Units and Projects**, spread across India and international operations.

The Group-level report is built from what comes up from the bottom of that hierarchy.

Here's how it works. A project officer enters a number. That number becomes part of a Business Unit total. The Business Unit feeds into the Subsidiary. And finally, approved information goes into the Group report.

So if the data isn't controlled at the project level, the problem just travels upward.

That's why we designed ESG360 around the organizational hierarchy itself.

Slide 6:

From there, we turned the problem into a set of clear requirements.

Data is fragmented, so we need one central place to collect it.

People use different formats, so we need standardized entry.

Numbers can change suddenly, so we need validation and year-on-year checks.

A number needs proof, so the evidence should stay attached to it.

Several people are involved in review, so we need a proper approval workflow instead of relying on emails.

Data has to move from Project to BU, Subsidiary and Group, so consolidation should happen inside the system.

And when a number lands in the BRSR report, we should be able to trace it back to where it came from.

So ESG360 isn't one feature trying to fix everything.

Each part of the system answers one specific problem in today's process.

Slide 7:

This slide shows the core idea of the solution.

Picture a project officer entering a diesel value.

The system doesn't just take that number and push it into the final report.

First the data is entered. Then it's validated. The supporting evidence is attached and verified. The right person reviews it. And only after approval does it become part of official consolidation.

From there it moves up through the organization, gets mapped to the relevant BRSR requirement, and ends up in the report.

And the last step matters most: **we can trace it back.**

So it's not simply:

Data in → Report out.

It's:

Data → Validate → Evidence → Approve → Consolidate → BRSR → Report → Trace back.

That whole chain is what ESG360 is about.

Slide 8:

We've simplified the journey into six stages.

First, **Collect**. The project enters its ESG data and supporting evidence.

Second, **Validate**. The system checks the data and flags things like unusual year-on-year changes.

Third, **Approve**. The responsible reviewer checks the submission and either approves it or sends it back for correction.

Fourth, **Consolidate**. Approved project data moves up from Project to BU, Subsidiary and Group.

Fifth, **Trace**. We keep the link between the reported KPI, its original record, the project, and the evidence.

And last, **Report**. Approved information feeds into BRSR reporting and can be exported where needed.

One rule is especially important here:

Only approved data enters official consolidation.

So if a submission is still pending, or has been sent back for correction, it won't quietly change the Group-level numbers.

Slide 9:

Now, who actually uses the system?

We don't want everyone to see everything.

A **Project ESG Officer** mainly works on their own project: entering data, uploading evidence, and responding to corrections.

The **BU Reviewer** sees the relevant projects and checks whether the submitted information is correct.

The **Subsidiary ESG Manager** gets a wider view across the Business Units under that subsidiary.

At the top, the **Group ESG Team** works with the consolidated ESG information and the BRSR reporting.

Then there's the **Auditor**. An auditor doesn't need to edit anything. They need to verify. So they get read-only access to the relevant metrics, evidence, calculations and audit trail.

And finally the **Admin**, who controls the structure of the system: users, hierarchy, indicators, units and rules.

The principle is simple:

People get access based on their responsibility, not on convenience.

Slide 10:

This is one area where ESG360 goes beyond just collecting numbers.

Let's use diesel as a real-world example.

Say a project reported **8,000 litres last year**, and this year it reports **15,000 litres**. That's an increase of **87.5 percent**.

Again, we're not saying 15,000 litres is wrong. The system is just saying:

"This change is significant. Please check it."

The user can then add supporting evidence. We also run basic checks, like invalid or negative values and units. And the evidence stays linked to the ESG record.

For every uploaded file, ESG360 stores a **SHA-256 fingerprint**. When the file is verified later, the system can check whether it still matches that fingerprint.

So there are several layers of control:

Is the value valid? Is the change reasonable? Is the evidence attached? And is the evidence still intact?

That makes the data much easier to trust.

Slide 11:

Once the data is collected and validated, the next question is:

How do we turn raw project data into meaningful ESG numbers?

Take electricity. A project enters its consumption in kWh.

The system first converts the value into a standard unit. Then, where it applies, the relevant emission factor is used to calculate the CO_2e value.

The same general approach works across energy, Scope 1, Scope 2, Scope 3, water and waste.

So instead of treating ESG as a bunch of unrelated Excel cells, ESG360 treats it as structured data that moves through a defined calculation and reporting process.

For example, **1,20,000 kWh can be represented as 120 MWh**, so data from different projects follows one common format.

And once it's standardized, it's ready for consolidation and reporting.

Slide 12:

This is where the hierarchy really pays off.

Let's take three illustrative projects. Project A has **120 MWh**. Project B has **80 MWh**. Project C has **150 MWh**.

Once all three are approved, the Business Unit total is:

120 + 80 + 150 = 350 MWh.

Now suppose Project D is still waiting for approval. Its number shouldn't suddenly show up in the official total.

That's why ESG360 uses approval status as a gate. Only approved project data goes into official consolidation.

And the same principle holds all the way up:

Project → Business Unit → Subsidiary → Group → BRSR.

One more thing. A project user can't just type in a Group total. It's calculated from approved lower-level data.

So the final number is built from the ground up, not entered manually at the top.

Slide 13:

Now we get to the reporting side.

The goal isn't just to collect ESG data and keep it inside the application. It has to connect to BRSR reporting.

So ESG360 maintains an indicator structure that includes the **indicator, section, principle, metric, unit, calculation and evidence requirement.**

The reporting follows the three BRSR sections:

Section A — General Disclosures. Section B — Management and Process Disclosures. Section C — Principle-wise Performance.

Our current implementation gives representative coverage across Principles 1 to 9, and supports reporting through PDF and XLSX export.

So by the time validated, approved and consolidated data reaches the reporting stage, it's not just a set of numbers. It has a defined link to the relevant BRSR structure.

That's what makes it **BRSR-ready**.

Slide 14:

For me, this is one of the most important parts of the whole solution.

Imagine a reviewer looking at a number in the final BRSR report. Instead of hearing,

"*That came from an Excel sheet somewhere,*"

they should be able to ask:

"Where did this number actually come from?"

And ESG360 answers that, step by step.

Start with the **BRSR KPI**. From there, go to the **report snapshot**. Then the approved **ESG record**. Then the **indicator**. Then the **project**. And finally the original **evidence**.

We also keep the approval history: who did what, when, which action they took, and what comment they left.

If a value is changed, the system records the old value, the new value, and the reason.

So you don't just get a final number. You get the story behind it.

That's what we mean by traceability.

Slide 15:

Let me quickly explain how we built it.

The frontend uses **React, Vite and TypeScript**. The backend is **Node.js, Express and TypeScript**. For storage we use **MongoDB Atlas**. And for authentication and authorization, we use **JWT, role-based access control and bcrypt**.

What matters here is that we picked the technology around the workflow, not the other way around.

We have separate modules for ESG records, evidence, validation, approval, analytics, BRSR, reporting, and audit and traceability. All of them work inside the same hierarchy:

Group → Subsidiary → Business Unit → Project.

So technically, the architecture mirrors the business problem we're solving.

Slide 16:

This slide shows how the same platform looks different depending on who's using it.

A Project Officer gets a workspace to enter ESG data and upload evidence.

A Reviewer gets a workspace to check submissions and approve them or ask for corrections.

Management gets analytics and KPI trends.

The reporting team gets the BRSR report builder and export options.

An auditor gets traceability, not editing access.

And the administrator controls users, hierarchy, indicators and system rules.

So we're not building six different systems.

It's **one platform with different controlled experiences for different users.**

The screenshots here should be actual application screens in the final presentation, so the judges can see these are working parts of the solution and not just design concepts.

Slide 17:

If I had to sum up the difference between the old approach and ESG360 on one slide, it would be this.

Before, the process could get **fragmented**. With ESG360, it's **centralized**.

Before, validation was often manual. Now, validation rules and review stages are part of the workflow.

Before, evidence might sit away from the number. Now, evidence is connected to the ESG record.

Before, approvals could be hard to follow across emails and files. Now, the process is role-controlled.

Before, tracing a final number back to its source was difficult. Now, the system keeps that connection.

And instead of treating BRSR as something that only happens at the very end, we link the underlying ESG data to the BRSR structure from inside the platform.

So the difference isn't just that we replaced Excel with a website.

We changed how the data moves through the organization.

Slide 18:

Let me close with one simple example.

A project employee enters one ESG value. It's validated. The supporting evidence is attached. The responsible reviewer checks it.

Once approved, it becomes part of the Business Unit data. From there it feeds into the Subsidiary and Group-level information. The approved data is then linked to the relevant BRSR indicator and reporting structure.

And when someone questions the final number, we don't stop at the number. We can walk back through the chain and find the original record, the project, and the supporting evidence.

That's the core idea behind **MEIL ESG360**.

We're not just generating another ESG report.

We're creating a controlled chain, from the point where ESG data is created to the point where it becomes part of the final Group-level BRSR report.

Thank you.
